One-Take Showreel

Make a silent 15-second fictional brand film as one continuous transformation. The starter contains a working demo and editable source. Custom brands still need actual logo geometry, design and visual review.

Copy this prompt

Read SKILL.md. Scaffold the FORM demo at 15 seconds vertical, render it locally, inspect the final output, and show me the review video and editable files. Keep it silent and label it as a demonstration brand.

Setup

Node 22+, npm, HyperFrames, FFmpeg and a supported renderer browser. Run npm ci in the repo, then node scripts/create.mjs demo-film. Inside demo-film run npm run check and npm run render.

Know the limits

The demo is a starter, not evidence of professional output for every brand or increased engagement.

github.com/KralSamwise/one-take-showreel

Edit Style Memory

Keep observed reference patterns separate from explicitly approved editing preferences. Resolve preferences only for the matching project and format.

Copy this prompt

Read SKILL.md. Run the synthetic reference example, then the approved-feedback example. Show the resulting profile and the preferences resolved for demo-brand. Also resolve a different project to demonstrate that the settings do not leak across scopes.

Setup

Python 3.10+ for profiles/preferences. FFmpeg and ffprobe for optional local video measurement. Run python3 scripts/style_memory.py --help.

Know the limits

Review detected cuts and silences before approving observations. The sample is synthetic. The tool does not edit video or infer what makes a creator successful.

github.com/KralSamwise/edit-style-memory

Render Review

Collect contact sheets, transition strips and a hash of the exact exported video. The final frame is always sampled.

Copy this prompt

Read SKILL.md. Run the included synthetic integration test, then create an evidence pack for my exported video. Inspect every contact page and transition strip. Report timestamped findings. Keep motion and audio marked not-reviewed unless you actually play and listen.

Setup

Python 3.10+, Pillow, FFmpeg and ffprobe. Install requirements.txt in a virtual environment. Run python3 scripts/review_pack.py render.mp4 --events 2.4,6.8 --out review.

Know the limits

Successful decoding is not aesthetic approval. Samples can miss defects between frames. Review the complete playback before publishing.
